

SYSTEM ARCHITECTURE WITH COGNITIVE FALLBACK

FIG. 1

STATE TRANSITION DIAGRAM

Transition Summary

206: Timeout triggers fallback

212: Direct reconnection

208: Explicit resync request

214: Autonomous step loop

210: Resync completes

—— Initial state

----- Direct reconnect

FIG. 2

ENERGY-AWARE MODULATION CURVE

Behavioral Effects			302
< 15 mWh	mod = -0.4	Maximum conservation	
15-30 mWh	mod = -0.1	Cautious operation	
30-80 mWh	mod = 0.0	Standard processing	
> 80 mWh	mod = +0.3	Exploration enabled	

FIG. 3

AUTONOMOUS INPUT GENERATOR OUTPUT

Autonomous Input Formula

$$\text{circadian} = 0.5 + 0.2 \times \sin(2\pi \times t \times 3)$$

burst = 0.3 (with 10% probability per step)

404

Energy Recovery During Autonomous Operation

FIG. 4

RESYNCHRONIZATION PAYLOAD STRUCTURE

FIG. 5

RECOVERY SCENARIOS

Scenario A: Normal Reconnection

600

Scenario B: Crash Recovery

602

Scenario C: Clean Shutdown

604

Recovery Guarantees

606

Normal reconnection: Full continuity, resync payload transmitted
 Crash recovery: Max 50 steps lost (snapshot every 50 steps)
 Clean shutdown: Zero data loss (final snapshot on EOF)
 Max autonomous duration: 10,000 steps (~50 hours)

———— System actively processing

FIG. 6

END-TO-END SIGNAL FLOW Connected vs. Autonomous Operation

CONNECTED MODE

DISCONNECTION EVENT (heartbeat timeout > 30s)
Seamless transition - no interruption to SNN or Harvester

720
resync()

Self-Observation (Patent B)

AUTONOMOUS MODE

Signal Pathways

- Forward signal path
- - - - - Energy/control feedback
- Self-Observation feedback (Patent B)
